构建模型方法

Debugging a learning algorithm:

Suppose you have implemented regularized linear regression to predict housing prices.

$$\longrightarrow J(\theta) = \frac{1}{2m} \left[\sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \lambda \sum_{j=1}^{m} \theta_j^2 \right]$$

However, when you test your hypothesis on a new set of houses, you find that it makes unacceptably large errors in its predictions. What should you try next?

- Get more training examples
- Try smaller sets of features

- Try getting additional features
- Try adding polynomial features $(x_1^2, x_2^2, x_1x_2, \text{etc.})$
- Try decreasing λ
- Try increasing λ

机器学习诊断法

Machine learning diagnostic:

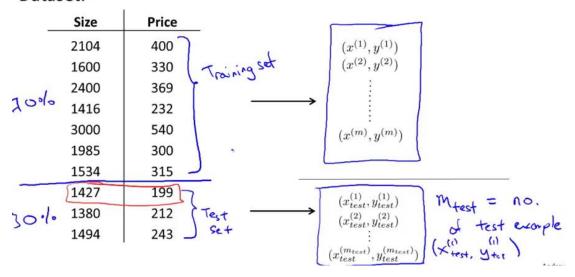

Diagnostic: A test that you can run to gain insight what is/isn't working with a learning algorithm, and gain guidance as to how best to improve its performance.

Diagnostics can take time to implement, but doing so can be a very good use of your time.

Train/validation/test error

Training error:

$$J_{train}(\theta) = \frac{1}{2m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

Cross Validation error:

$$J_{cv}(\theta) = \frac{1}{2m_{cv}} \sum_{i=1}^{m_{cv}} (h_{\theta}(x_{cv}^{(i)}) - y_{cv}^{(i)})^2$$

Test error:

$$J_{test}(\theta) = \frac{1}{2m_{test}} \sum_{i=1}^{m_{test}} (h_{\theta}(x_{test}^{(i)}) - y_{test}^{(i)})^2$$

偏差 Bias 和 方差 Variance

Diagnosing bias vs. variance

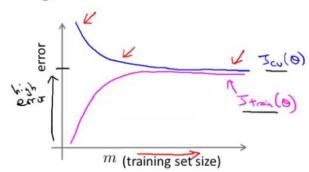

Suppose your learning algorithm is performing less well than you were hoping. ($J_{cv}(\theta)$ or $J_{test}(\theta)$ is high.) Is it a bias problem or a variance problem?

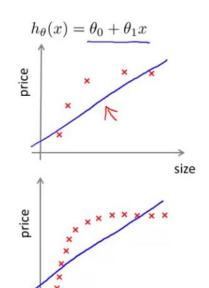

Variance (overfit):

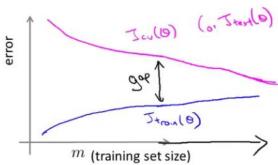

High bias

If a learning algorithm is suffering from high bias, getting more training data will not (by itself) help much.

High variance

If a learning algorithm is suffering from high variance, getting more training data is likely to hod 增加更多的训练集数据

price

 $h_{\theta}(x) = \theta_0 + \theta_1 x + \dots + \theta_{100} x^{100}$ (and small λ) size

- Try getting additional features fixes high bias
- Try adding polynomial features $(x_1^2, x_2^2, x_1x_2, \text{etc}) \rightarrow \text{five high bias}$.
- Try decreasing & fixes high hier
- Try increasing \(\rightarrow \text{ fixes high vorionce} \)

Neural networks and overfitting

"Small" neural network (fewer parameters; more prone to underfitting)

Computationally cheaper

Use regularization (λ) to address overfitting.
